MDT 500-46 (MILL DUTY THRUSTER BRAKES)

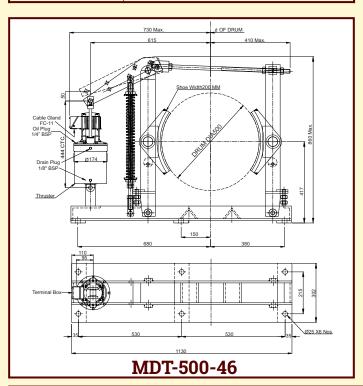

INTRODUCTION

Thruster Brake is a device to retard the speed of moving machinery and to stop it accurately to the desired position. The breaking force is applied to the brake shoes by a pre-stressed compression spring. The shoes press on the rotating brake drum retarding its speed, and finally stopping it.

SELECTION OF BRAKE SIZE

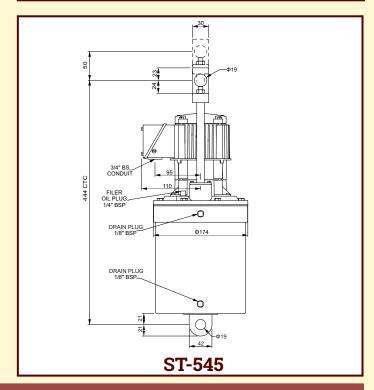

Electo-hydraulic thruster is a device which develops linear thrust (or force) required to operate the required mechanism. The input to the device is three phase supply.

The brake torque must be = >than motor full load as referred with drum. Formula as below:

T = Torque in Kgm =
$$\frac{716 \times Hp}{rpm}$$

T = Torque in Nm =
$$\frac{9552 \times Kw}{rpm}$$

Where Hp/Kw = motor output & rpm = Rev/minute
